PRODUCT INFORMATION GOBRIGHT POWER CONTROL PLUG

The Power Control Plug is a accessory for the GoBright Interact. The PCP powers the desk workstation only when checked in, reducing energy use, saving costs, lowering your environmental impact, and increasing the accuracy of your occupancy data.

It supports a Bluetooth range of approximately 15 meters and allow up to five Power Control Plugs to be connected to a single Interact device. Designed exclusively for use with the Interact, these Power Control Plugs are available in EU, UK and USA versions.

WHY USE IT & WHAT IS THE ROI OF THE GOBRIGHT POWER CONTROL PLUG?

How it fits in the GoBright ecosystem
The Power Control Plug complements existing GoBright Interact. It extends the platform by introducing power control logic to desk amenities—something not covered by other existing devices. The integration emphasises the holistic nature of GoBright's hardware & software.

Return on investment (ROI)
Modern desk workstations still draw power in standby mode, based on **2 monitors, a Thunderbolt hub, and a power hub.** A typical desk setup consumes approximately **10 W per hour,** even when not in use.

If the workstation is active for **8 hours a day**, it's generally in standby for approximately **16 hours.** Including weekends, that would amount to **128 hours per week**!

With the **average UK electricity cost at €0.35 per kWh**, that standby power amount to approximately **€24 per desk workstation per year** in wasted energy. **How many desk workstations does your company have?**
